

Ground, Wind, Weed
& Erosion Control

COIR PALLETS

Supports growth and development of plants to secure banks and shorelines. Can be supplied pre-established with UK native species or unplanted.

Coir pallets are designed to assist in reducing erosion along river and lake banks, along with the coir pallets offering a product to allow planting to take place along the bank to help create a firm base for the banks to be built up against, thereby reducing soil and stone erosion on the bank and allowing vegetation and grasses to grow to stabilise the bank.

Once established they become a cover and/or habitat for wildlife. These pallets are compressed coir fibre encased in coir netting. They support growth and development of plants to secure banks or shorelines. They can be supplied pre-established with UK native species or unplanted.

Specification

| | |
|---------------------|--|
| Size | 2m x 1m = 2m |
| Weight | Wet: approximately 25kg Dry: approximately 12kg |
| Density | Approximately 5kg/m |
| Coir Netting | 400g/m, 35mm x 35mm mesh size |
| Supplied | Pre-established or UK native species or unplanted |
